

**PAC USING HOOD, HOSE & BALANCER
SERIES PAC**

The Series PAC (Pivoting Articulated Crane) Arm may be supplied with a 24" round hood. The system also features a hose and return balancer for all types of vehicle exhaust pipes. This system is designed so the hood can be located above a vertical stack from the ground, while the hose and balancer may be used for under chassis exhaust pipes. The unique range of movement of the PAC allows the hood to be positioned over the stack anywhere within the radius of the PAC. Material can be draped from the hood to further enclose the vertical stacks and give greater versatility for multiple height stacks. The extraction hose is available in lengths of 15', 20' or 25'. Hose diameters range from 4", 5", or 6".
